Surface Area and Volume of Traditional American Indian Homes

Fast Facts

Curriculum Area: Mathematics
Grade Level: Grade 8
Suggested Duration: 100 minutes

Stage 1 Desired Results

Established Goals

Montana Content Standards for Mathematics:
Geometry 7.G.6 Solve real-world and mathematical problems from a variety of cultural contexts, including those of Montana American Indians, involving area, volume, and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms.

Geometry 8.G.9 Know the formulas for the volumes of cones, cylinders, and spheres and use them to solve real-world and mathematical problems.

Indian Education for all Essential Understandings Regarding Montana Indians

Essential Understanding 1 There is great diversity among the twelve sovereign tribes of Montana in their languages, cultures, histories, and governments. Each tribe has a distinct and unique cultural heritage that contributes to modern Montana.

Essential Understanding 2 Just as there is great diversity among tribal nations, there is great diversity among individual American Indians as identity is developed, defined, and redefined by entities, organizations, and people. There is no generic American Indian.

Understandings

- There are several different types of traditional American Indian houses.
- Traditional American Indian houses contain various plane and solid geometric figures.
- How to find surface area of various plane geometric figures.
- How to find volume of various solid geometric figures.

Essential Questions

- What are some types of traditional American Indian houses?
- What plane and solid geometric shapes do some traditional American Indian houses contain?
- How do you calculate surface area and volume of traditional American Indian houses?
- How would knowing surface area and volume help a builder construct a building?
Students will be able to...
- identify a variety of geometric plane and solid figures.
- calculate area of geometric plane figures and surface area and volume of geometric solids.

Students will know...
- how to find area of various geometric plane figures.
- how to find surface area and volume of various geometric solid figures.

Stage 2 Assessment Evidence

Performance Tasks
1. Build a structure out of wooden dowels and rubber bands.
2. Compare geometric plane and solid shapes to traditional American Indian houses.
3. Identify a variety of geometric plane and solid figures.

Other Evidence
1. Teacher observations of student participation during all portions of the lesson.
2. Student presentations.
3. Peer assessment and input during small-group activities.
4. Question responses of individual students.
5. Homework assignment (found later in the lesson).

Stage 3 Learning Plan

Learning Activities
A. Open and “hook”

Use cards chosen out of a standard deck to allow for random grouping upon entry into the classroom by the students. For groups of two, use two of each card number. For groups of three, use three of each card number. For instance, all the Aces will be in a group, all the Kings will be in a group, etc.

As students enter the room, have them draw a card out of the deck. Ask them to find the other student(s) that have the same numbered card and sit at a table or group of desks.

State the “Understandings” for the lesson.
Show the kids some dowels and a bag of rubber bands. Explain that each group will get 16 dowels and a bag of rubber bands. Inform the kids they are going to make a structure out of these materials that has to be tall enough for a 4-foot tall person to stand in it.

Issue the materials to each group and inform them they have ten minutes to complete their structures and that all in the pair/group must participate.

**B. Survey ideas for naming plane and solid figures**

Ask students to go around the classroom. Inform them they are to record on paper the names of every plane and solid figure they can find on the dowel structures, and to who the structure belongs. Give them three minutes to do this.

Record the information the students wrote down on the board in two columns, one for plane figures and one for solid figures (sample responses may include: rectangles, triangles, squares, and pentagons for planes; various pyramids or prisms for solids). Discuss as a class.

Distribute the Student Area and Volume Handout to each student. Ask the students to decide which of the shapes from the handout were created in their constructions. Have the students do this in a “Think, Pair, Share” format (think about it, share with the person they sat by, and be ready to share with the class). Discuss as a class.

**C. Familiarizing students with traditional American Indian housing**

Distribute a student handout, which you create, pertaining to different types of traditional American Indian housing, make overheads to display for the students, or project the Native American Homes Web page.

Have each student decide which (if any) of the traditional American Indian housing their dowel structure resembles. Be sure to discuss the writings accompanying each house style.

Have each group present orally to the class the type of house they chose and explain why. If a group did not come up with one, assign one the other students are not utilizing. Each group should determine which geographic region of Native Americans most likely utilized this type of dwelling. In addition, groups should determine, which, if any, Montana tribal group(s) would have utilized this dwelling.

**D. Calculate surface area and volume for the dowel houses chosen by each group**

In groups, have students sketch a picture of the traditional housing type that they chose. Tell them to use geometric plane and solid figures from the first student handout in their drawings. Have students complete all of the steps individually, utilizing their partner for assistance and comparisons.

Ask the students to label each shape that makes their house what it is (i.e., circle, triangular prism, rectangle, cone, etc.).
Using the handout from part “C,” have the students label dimensions on their sketch to the nearest foot. The teacher may need to assist with estimations if actual dimensions are not provided.

Discuss how they could calculate how much material they might need to create a fully covered house. Lead the discussion towards surface area. Have the students calculate the surface area of their house, explaining their process and reasoning to their partner as they progress. One group member can be a “traveler” if the group is stuck to consult another group for assistance. Circulate about the room and assist if needed.

Have the students share what they did to the class on the board. All group members must participate in the presentation.

Now have students find the volume of their houses using the steps above.

E. Assign Surface Area and Volume of Traditional American Indian Homes

How would knowing surface area of a traditional home help the builder? How about builders of modern-day homes? **Possible answer: to know approximately how much material is needed to build.**

How would knowing volume of a traditional home help the builder? How about builders of modern-day homes? **Possible answer: to know approximately how much space there would be inside.**

Find two different solid shapes in real life. Select items that can be found on our formula sheet.

Draw a picture of each and explain what the shapes represent.

Measure the dimensions, and label them on your picture.

Calculate the surface area and volume of the two shapes.

Be ready to present the results of your homework in class tomorrow.

**Materials/Resources Needed**

A deck of standard playing cards.

Enough wooden dowels and bags of rubber bands for each group. Each group will need sixteen 3-foot wooden dowels and a bag of rubber bands. If access or money is an issue, plastic straws may be substituted for wooden dowels; however, the lesson steps would need to be modified.

Copies of the student handouts for each student (furnished at the end of the lesson). You may also choose to make overhead transparencies of the handouts for discussion purposes.

**Additional possible resource**

**Montana Content Standards and IEFA Essential Understandings Regarding Montana Indians**
Student Area and Volume Handout

Name ____________________________

Triangle

\[ \text{Area} = \frac{1}{2} b \times h \]

Parallelogram

\[ \text{Area} = bh \]

Trapezoid

\[ \text{Area} = \frac{1}{2} h (b_1 + b_2) \]

Circle

\[ \text{Area} = \pi r^2 \]
\[ \text{Circumference} = 2\pi r \]

Cylinder

\[ \text{Volume} = \pi r^2 h \]
\[ \text{Surface Area} = 2\pi r^2 + 2 \pi rh \]

Prism

\[ \text{Volume} = Bh \]
where \( B \) = area of base

Cone

\[ \text{Volume} = \frac{1}{3} \pi r^2 h \]

Pyramid

\[ \text{Volume} = \frac{1}{3} Bh \]
where \( B \) = area of base
Surface Area and Volume of Traditional American Indian Homes

1. How would knowing surface area of a traditional home help the builder? How about builders of modern-day homes?

2. How would knowing volume of a traditional home help the builder? How about builders of modern-day homes?

3. Find two different solid shapes in real life. Be sure the items have shapes that can be found on our formula sheet.

4. Draw a picture of each and explain what the shapes represent.

5. Estimate or measure their dimensions and label them on your picture.

6. Calculate the surface area and volume of the two shapes.

Be ready to present the results of your homework in class tomorrow in groups of four.
